

I would like to know how the FCC plans on managing the interference caused by BPL during the implementation testing. The public utility companies are looking for one thing - a new revenue stream. It is my opinion, and that of many others, that they are going to be installing this service regardless of what the FCC may or may not impose as regulations. Why do I say this? Because the FCC has been changing their opinion frequently.

If there are many organizations such as FEMA and the FAA that are apposed to this service, and they have good reason to be apposed, I simply can't understand the position the FCC is taking to encourage the continued deployment until ALL the HF interference can be eliminated.

Thanks for (I hope) listening,

Bruce Meier
